

Precision transfer machine

The EPIC R/T features new technology EMC—Embedded Motion Control—developed by a team of electrical engineers at Hydromat's Corporate Campus. This technology features plug & play control architecture that is integrated or embedded into each toolspindle unit. The EPIC R/T allows for fully-independent and programmable functionality for each axis motion, thus eliminating the use of conventional Hydromat valves and more complex CNC control components. When a tool spindle

is moved from one location on the machine to another, the only change needed is to program the unit's stroke. Programming of the unit can be done off-line and downloaded from a remote location or the units can be programmed at the machine.
