

Affordable CNC rotary transfer

Hydromat's Epic R/T product line boasts full-CNC rotary-transfer machines at price tags comparable to the company's current non-CNC machines. What makes this possible is embedded motion control (EMC), which features

special plug-and-play programmable valves integrated, or embedded, into each toolspindle unit to virtually eliminate conventional valves and complex CNC components.

EMC simplifies the Epic R/T's CNC hardware components, which reduces the machine's overall cost (approximately 25% less than current CNC Hydromat machines without EMC technology). Additionally, Hydromat modifies the basic machine casting used on its rotary-transfer machines to eliminate components originally needed for supporting non-CNC or partial-CNC Hydromat machines.

Other Epic R/T benefits include quick and easy changeovers (typically 1 to 3 hr), easy centralized programming, and competitive manufacturing for small, medium, and large-production quantities.
